Floor Decal Installation

- 1 Begin by sweeping the floor clean of dust and debris.
- 2 Using a tape measure find the mounting location for the floor decal so that it is consistent with distancing or wayfinding protocol. For best results wipe the mounting location with a rag and isopropyl alcohol to remove any oils or residue. Allow the surface to dry thoroughly.
- 3 Once decal is in desired location run a piece of masking down the middle of the decal. Make sure there is enough excess tape on both sides to insure the decal remains anchored in place. Carefully pull one side of the decal up away from the backing liner at a 45 degree angle. Using a utility knife cut away the excess liner.
- 4 Hold the exposed decal just over the mounting surface making sure that it is taut. Start applying the decal from the center using the squeegee with firm overlapping strokes. The squeegee should be held at a 45 degree angle to prevent trapped air bubbles.
- 5 Now that half of the decal has been applied and it is fully anchored to the surface- you can now remove the remaining masking tape. Peel back the other half of the decal, remove the remaining backing liner, and apply the rest of the decal in the same manner.
